

ASCOT
RADIOLOGY
FERTILITY IMAGING

AT ASCOT RADIOLOGY, we offer the full range of fertility imaging examinations.

A hysterosalpingogram (HSG) is a diagnostic test to evaluate the patency of the fallopian tubes, which can be done either under ultrasound (HyCoSy) or x-ray imaging. This procedure is also shown to improve conception.

A Lipiodol HSG or Lipiodol flush is a therapeutic procedure to assist conception that may be done once patent fallopian tubes have been confirmed. Recent studies indicate this may significantly improve the chance of becoming pregnant.

Other examinations we offer in this area are **high quality pelvic ultrasonography, including 3D ultrasound** to evaluate for causes of subfertility; **saline sonohysterography** (which is ultrasound after instillation of saline into the uterus), if there are concerns regarding the uterus shape or the uterine cavity; **follicle tracking ultrasound** and **expert pelvic MRI**.
